

Day 3 - API Integration Report - [Ann Fashion Store]

Hackathon Task #3

Schema Overview

The productPage schema defines the structure for storing product-related information, such as names, prices, descriptions, and images. It is of type document, meaning it can be used to create and manage multiple entries in Sanity CMS.

Usage in Sanity CMS

- This schema will appear in Sanity Studio under the name **Products**.
- Each product can have a unique name, price, description, and image.
- Ideal for e-commerce projects where maintaining a product catalog is required.

Benefits

- Simple and easy-to-understand structure.
- Flexibility to handle essential product details.
- Direct integration with Sanity CMS allows efficient management of product data.

This schema ensures that your product data is well-structured and easy to manage while maintaining compatibility with your marketplace backend.

```
1  import { defineField, defineType } from "sanity";
2
3  export const productPage = defineType({
4    name: 'post',
5    title: 'Products',
6    type: 'document',
7    fields: [
8      defineField({
9        name: 'ProductName',
10       title: 'Product Name',
11       type: 'string',
12     }),
13     defineField({
14       name: 'ProductPrice',
15       title: 'Product Price',
16       type: 'string',
17     }),
18     defineField({
19       name: 'ProductDescription',
20       title: 'Product Description',
21       type: 'string',
22     }),
23     defineField({
24       name: 'ProductImage',
25       title: 'Product Image',
26       type: 'image',
27     }),
28   ],
29 });
30
```
